Acupuncture Education Standards in Australia: A Critical Review

ABSTRACT

The implementation of the National Registration and Accreditation Scheme for the Health Professions incorporates the registration of acupuncturists under the Chinese Medicine Board of Australia from 1 July 2012. Other registered health professionals will still be able to use the title acupuncturist if their board determines that they are suitably qualified to have their registration endorsed for acupuncture. This paper aims to identify the various education and training standards underpinning the practice of acupuncture among the health professions in Australia and create a reference point to determine the impact of registration on future acupuncture education standards. A literature search was conducted to identify scholarly works on acupuncture education standards as well as a search of standard setting bodies and course providers. Results were tabulated for comparison. There is very little literature on acupuncture education standards in Australia despite its practice by a diverse range of health professions. Acupuncture practitioners can be categorised into four groups: Chinese medicine practitioners, medical practitioners, registered allied health practitioners and non-registered health practitioners. The highest education standards are demonstrated by Chinese medicine practitioners who typically complete at least a four year undergraduate degree, whereas the latter two groups appear to favour two or three day continuing professional development courses despite the availability of post-graduate programs. The standards for medical practitioners are obscured by a non-transparent accreditation process. Restriction of title registration in Victoria has coincided with a trend for these short courses to be described as ‘dry needling’ rather than acupuncture, thus circumventing the education standards, regulatory processes and protection of public health and safety which underpins occupational regulation. National boards will need to collaborate and carefully consider their acupuncture accreditation standards if they are to fulfil the objectives of the National Registration and Accreditation Scheme.

KEYWORDS acupuncture, dry needling, Chinese medicine, education standards, regulation, Australia.

Introduction

The National Registration and Accreditation Scheme for the Health Professions (NRAS) was established by the Council of Australian Governments (COAG) to create a single scheme to register health professions nationally. From 1 July 2010 chiropractors, dentists, medical practitioners, nurses and midwives, optometrists, osteopaths, pharmacists, physiotherapists, podiatrists, and psychologists moved from State based registration to the NRAS. Four additional professions will be included from 1 July 2012, namely Chinese medicine practitioners (including acupuncturists); Aboriginal and Torres Strait Islander health workers; medical radiation practitioners; and occupational therapists. The primary objective of the NRAS is to protect public health and safety by ensuring that only ethical, suitably trained and qualified practitioners are registered to practise. A further objective is to foster a high standard of education and training among health practitioners. Under the scheme accreditation authorities recommend accreditation standards to the national boards for approval, and assess education programs against approved accreditation standards. Currently there is no functional national accreditation authority for acupuncture, with acupuncturists registered in only one State, Victoria.

From 1 July 2012 the use of the title acupuncturist will be restricted outside of Victoria for the first time. Restriction of title allows the public to identify practitioners who are qualified to practise safely and competently while prohibiting those who are not registered from using the title. Only suitably registered or endorsed practitioners will be able to use the title acupuncturist or hold out to practise acupuncture. Accreditation standards will need to be approved by the Chinese Medicine Board of Australia (CMBA) in order to register practitioners. In addition to the CMBA accreditation standard, each of the other thirteen health boards may also set a standard to endorse their practitioners for the practice of acupuncture. The Health Practitioner Regulation National Law Act 2009 (National Law) requires wide ranging consultation be undertaken in the development of an accreditation standard. Informed consultation is difficult without a review of the similarities and differences in the acupuncture education of the various occupational groups who seek to hold themselves out to the public as safe and competent acupuncturists.

In response, this paper reports the results of a critical review of the education standards underpinning the current practice of acupuncture in Australia. This review aims to identify the range of practitioners currently practising acupuncture in Australia; to identify the education standards underpinning their practice; and to create a reference point against which the success of the NRAS’s goal of fostering high education standards can be compared. This review also aims to inform registration boards, accreditation authorities and health policy makers on their deliberations regarding future accreditation standards.

ACUPUNCTURE IN AUSTRALIA

Acupuncture is currently being practised in Australia with varying degrees of education and training by acupuncturists, medical doctors, physiotherapists, chiropractors, osteopaths, podiatrists, nurses, massage therapists and other unregulated health practitioners. Acupuncture is one of the most popular and successful complementary and alternative medicine treatments used in Australia. It is estimated that 10.2 million acupuncture treatments are carried out annually in Australia, the majority of these provided by acupuncturists rather than medical doctors or other health professionals. Acupuncture is the main practice of Chinese medicine used in Australia, rising to prominence with the development of formal training courses in the 1970s. Most practitioners and teachers were non-Chinese, however immigration from Vietnam and China since the 1980s has altered the cultural mix of the profession in Australia. The result has been an increase in the popularity of Chinese herbal medicine and an increased proportion of Chinese and Vietnamese migrants comprising the Australian acupuncture and Chinese medicine workforce.

Acupuncture became a registered profession in Australia following the passage of the Chinese Medicine Registration Act 2000 (CMRA) in the State of Victoria. Practitioners in Victoria have been registrable as an acupuncturist, a Chinese herbal medicine practitioner, and/or a Chinese herbal medicine dispenser, depending upon their qualifications. Other registered health professionals in Victoria who also practise acupuncture are not required to register with the Chinese Medicine Registration Board of Victoria (CMRBV), as legislation enables their own board to assess their acupuncture education and instead endorse them as an acupuncturist. Outside Victoria the practice of acupuncture has continued without statutory regulation or any restriction on the use of the title ‘acupuncturist’; however this will end on 1 July 2012 when the jurisdiction of the CMBA commences under the NRAS.

Methods

An initial search was conducted of the University of Queensland (UQ) library catalogue and online journals. The keywords ‘acupuncture’, ‘education’, ‘regulation’, and ‘Australia’ were used to identify relevant literature. Of 258 results only two papers referred to education standards. An additional search using the same keywords was conducted using Medline resulting in 28 results. None of these results contained education standards for acupuncture. The same search was repeated on Web of Knowledge with 13 results, none relevant
to education standards. The A+ Education database was searched for ‘acupuncture’, ‘education’ and ‘Australia’ revealing one result which was a phenomenographic study.\textsuperscript{18} The search was widened to include the terms ‘myofascial’, ‘dry needling’ and ‘education’. This combination resulted in 67 results from UQ, none of them referring to education standards and 182 results from Medline, none referring to education standards. No date restriction was applied as historical standards were also of interest. Default search options were used for all databases. Most of the excluded results referred to clinical practice, risks or clinical research.

The lack of literature on acupuncture education standards in Australia led to a search for source documents from standards-setting bodies. The Australian Health Practitioner Regulatory Agency (AHPRA) website was searched for standards and consultations for each of the ten registered professions resulting in one consultation standard.\textsuperscript{19} The CMRBV website was searched for content relating to education standards resulting in the identification of another standard\textsuperscript{20}, and inferences on the standards applying to other registered professions in Victoria. Websites of other health professions in Victoria ceased to be available from 1 July 2010, so the Wayback Machine internet archive (http://www.archive.org/web/web. php ) was used to search copies of the chiropractic, medical and physiotherapy registration board websites for annual reports and standards regarding acupuncture endorsement, revealing the chiropractic and medical standards. The websites of peak professional associations representing Chinese medicine practitioners, natural therapists, massage therapists, physiotherapists, chiropractors, osteopaths, nurses and podiatrists were examined for either explicit standards for acupuncture or for advertisements for acupuncture courses. Explicit standards were only identified for the Australian Acupuncture and Chinese Medicine Association (AACMA).\textsuperscript{21} The Australian Natural Therapists Association has published a recognised course list and general guidelines on course duration, content and mode of delivery.\textsuperscript{22} The Australian Traditional-Medicine Society has a recognised course list\textsuperscript{23} but no explicit details on standards. Of the remaining professions searches recommendations for the duration and content of training programs could be identified for The Australian Association of Massage Therapists (AAMT)\textsuperscript{24} and the Australian Physiotherapy Association (APA)\textsuperscript{25}. Nurse’s professional indemnity insurance policies covered acupuncture but no education standards were identified.\textsuperscript{26} Advertisements for acupuncture and or dry needling courses were located on the websites of the Australian Osteopathic Association\textsuperscript{27} and the Australian Podiatry Association\textsuperscript{28} but no explicit standards were identified.

Private health funds and Medicare Australia are third party payers who tie education standards to provider status. Medicare Australia and the three largest private health insurers’ web pages were searched to identify standards for provider recognition.\textsuperscript{29–32} A Google search for ‘acupuncture courses’ ‘dry needling courses’ and ‘myofascial dry needling courses’ was conducted with results limited to Australia to identify courses and training providers which are offered outside of a regulatory framework. Twelve distinct courses were identified of mainly two or three days duration,\textsuperscript{33–41} with one four day course\textsuperscript{42} and two five day courses.\textsuperscript{43,44} Myotherapy courses at advanced diploma\textsuperscript{45–48} and degree level\textsuperscript{49} were also identified.

Standards were collated in a table to allow for comparison by criteria common to each (see Table 1). In addition the World Health Organization Guidelines for Basic Training and Safety in Acupuncture (WHO GBT)\textsuperscript{50} has been used for comparison to give an external reference point to Australian standards. Courses delivered outside of a statutory regulatory framework provided evidence of the minimum training underpinning acupuncture practice in their target markets (see Tables 2 and 3).

**Results**

The mixed regulatory environment of acupuncture practice in Australia means that the impact of a given standard varies, depending upon the profession practising it and the jurisdiction in which acupuncture is practised. Results of this review are organised to reflect this mixed environment and presented in the order as follows: the only existing national standard, standards in Victoria where acupuncture is a registered profession, and education standards developed by professional associations applied in the self-regulatory environment outside of Victoria. Standards developed by private health insurers and Medicare are also reported as they impact both within Victoria and the rest of Australia. Finally, the World Health Organization’s standard is presented for comparison.

**AUSTRALIAN GUIDELINES FOR TRADITIONAL CHINESE MEDICINE EDUCATION (AGTCME)**

In March 1998, the Australian Acupuncture and Chinese Medicine Association convened the National Academic Standards Committee for Traditional Chinese Medicine (NASC).\textsuperscript{51} The objective of the NASC was to develop curriculum guidelines for acupuncture and traditional Chinese medicine courses in anticipation of the needs surrounding the imminent passage of the Chinese Medicine Registration Act in Victoria.\textsuperscript{51} Prior to this the AACMA had developed the National Competency Standard for Acupuncture 1995 (NCS).\textsuperscript{52} Although the NCS determined that acupuncture programs should be at Australian Qualifications Framework level 7 (bachelor degree), the NCS was not a curriculum guideline and sought more to identify the scope of practice of acupuncturists in Australia.\textsuperscript{53}

In 2001, the NASC published AGTCMe which determined that the minimum education standard to achieve the necessary graduate outcomes in acupuncture is a bachelor degree in acupuncture-moxibustion, or a combined acupuncture and Chinese herbal medicine degree. A suitable degree in acupuncture alone would nominally be of at least four years duration, consist of approximately 2500 hours of instruction and be delivered substantially in face to face mode. For further details see Table 1. Graduate entry programs which met the guidelines would also be acceptable. A review of the guidelines is currently underway.

VICTORIA

In Victoria first the CMRA and now the Health Professions Registration Act 2005 (HPRA) which succeeded it require the CMRBV to develop and administer standards for course accreditation. A graduate of an approved course is eligible for registration without having to sit an examination. The CMRBV’s Guidelines for the Approval of Courses of Study in Chinese Medicine (GAC) set the minimum entry level for undergraduate courses at four years full-time study with at least 500–800 hours of supervised practical clinical training. The recommended breakdown of the program is similar to AGTCME (see Table 1) which informed the development of the GAC. Courses are to be conducted substantially by face to face mode of delivery. Unlike the AGTCME, the CMRBV has developed specific guidelines for graduate entry programs which may be undertaken by a graduate from a health discipline other than Chinese medicine (See Table 1). Flexible delivery may be considered due to the improved learning ability of a graduate compared to an undergraduate. The CMRBV has approved four undergraduate programs and two graduate entry programs (one in acupuncture and one in Chinese herbal medicine) under these criteria. At 30 June 2010, there were 1107 registered Chinese medicine practitioners in Victoria, 97% of which were registered as acupuncturists and 62% registered in both acupuncture and Chinese herbal medicine. In Victoria it is an offence under section 80(2) of the HPRA to use a registered title or hold out to be a registered practitioner unless registered or endorsed to use that title. Section 28 of the HPRA excludes chiropractors, dentists, medical practitioners, nurses, optometrists, osteopaths, physiotherapists and podiatrists from these provisions if their respective Board is satisfied that the practitioner is qualified in the practice of acupuncture. There is no requirement for these Boards to consult with the CMRBV on education standards. The CMRBV notes that most Boards have undertaken consultation.
anyway and applied a similar standard to the CMRBV’s for endorsement in acupuncture. A notable exception is the Chiropractors Board of Victoria which reduced its standard between 2007 and 2008 from the Master of Applied Science (Acupuncture) at RMIT University to the Graduate diploma in Acupuncture at RMIT. The other exception in Victoria is medical practitioners. The Medical Board of Victoria did not set an education standard for acupuncture endorsement directly, rather it accepted either of the courses approved by the Joint Consultative Committee for Medical Acupuncture (JCCMA), or qualifications acceptable to it by a specialist college. The JCCMA courses are an externally delivered Graduate Certificate in Medical Acupuncture from Monash University and a 40 contact hour course over 10 months called the Australian Medical Acupuncture College (AMAC) Qld & NSW combined course (see Table 1). This is the same standard required for Medicare payments for acupuncture items 193–199.

**DRY NEEDLING IN VICTORIA**

Acupuncture is also practised in Victoria by other occupational groups under the term ‘dry needling’. According to the Melbourne Institute of Massage Therapy (MIMT), ‘Dry needling focuses on the deactivation of myofascial trigger points (MTPs). Using single fine needles, the same needles that are used in acupuncture...’. The MIMT offers a 40 hour course on dry needling to students with a Diploma of Remedial Massage. Myotherapists complete either a two and one-half year full-time Advanced Diploma in Remedial Therapies or a four year Bachelor of Health Science – Clinical Myotherapy, each which entails two or three units in musculoskeletal acupuncture under the label ‘dry needling’, ‘myofascial needling’, or ‘myofascial dry needling’.

Short courses in musculoskeletal acupuncture under the term ‘dry needling’ are usually of two or three days duration and are also marketed to osteopaths, chiropractors, nurses, physiotherapists, medical practitioners, podiatrists, massage
therapists and other unregulated health professions. The term ‘dry needling’ is not a protected term under section 80(2) of the HPRA, so provided the practitioner is not deemed to be holding out to practise acupuncture the practitioner is exempt from both the punitive and regulatory provisions of the HPRA. A similar paradox will persist under the National Law when Chinese medicine is registered nationally.

STANDARDS OUTSIDE OF VICTORIA

The ten existing nationally registered health professions have the authority to develop criteria and endorse their registrants for acupuncture under section 97 of the National Law. Boards are required to consult widely when developing an accreditation standard under section 40. Only the Medical Board of Australia has commenced consultation on acupuncture endorsement ahead of the appointment of the CMBA. Professional associations, private health insurers, Medicare and course providers are otherwise the standard setters in the remaining States and Territories.

PROFESSIONAL ASSOCIATIONS

The largest acupuncture association is Australia is the AACMA. The AACMA requires a four year bachelor degree as the minimum standard for acupuncture accreditation. In addition the course must substantially be taught in face-to-face mode (not distance or flexible delivery). AACMA has accredited 11 Bachelor degree programs across Australia (some now discontinued) which lead to acupuncture accreditation with the association. AACMA has not accredited any graduate entry programs. In 2010, it had 1740 accredited members.

The Australian Physiotherapy Association (APA) established the Acupuncture and Dry Needling Group (ADNG) in 2007. The predecessor of ADNG was the Acupuncture Study Group established in 1979 based in NSW. The Acupuncture Study Group…has successfully trained over a thousand physiotherapists via the APA Level 1 and Level 2 Traditional Acupuncture courses. The ADNG differentiates training standards for dry needling, western acupuncture and traditional acupuncture. Suggested training varies from two days for dry needling to 150 hours for the level one traditional acupuncture course. Thirty hours of continuing education in acupuncture over three years is recommended following each course to maintain competence.

The AAMT is the peak body representing massage therapists with approximately 6500 members in 2008. AAMT has not prescribed education standards for the practice of acupuncture but has developed a Position Statement and Practice Guideline for Myofascial Dry Needling (PSMDN). The PSMDN identifies that dry needling is outside of the general scope of remedial massage, but can be provided with adequate training.

AAMT specifically recommends that members should have at least a diploma of massage, and that training should include infection control, occupational health and safety issues as well as relevant government regulations. A three-day dry needling workshop is advertised on the opposite page to the guidelines.

PRIVATE HEALTH INSURERS

Private health insurers were required to implement Rule 10 of the Private Health Insurance (Accreditation) Rules 2008 (PHIAR) from 1 July 2009. The PHIAR enacted quality and safety requirements for private health fund providers. Rule 10 specifically applies to providers who are not regulated by Medicare or a centralised body and specifically included complementary therapists. Providers now have to be members of a national professional association which: assesses members training and education; administers a compulsory continuing education scheme; maintains a code of conduct; and administers a formal disciplinary mechanism.

The standards which individual insurers have applied for compliance with Rule 10 vary between insurers. Bupa Australia (BUPA) and Medibank Private (Medibank) are the largest private health insurers in Australia with a market share of 27.1% and 31.3% respectively. The next largest insurer is The Hospitals Contribution Fund of Australia Ltd/Manchester Unity (HCF) with a market share of 10.3%. BUPA requires acupuncturists to be a member of one of three specified associations and have a bachelor degree which broadly complies with the AGTCME (see Table 1). Medibank does not prescribe any academic qualifications and requires membership of any one of eight associations. The education standard for membership of these associations varies from an advanced diploma to bachelor degree to graduate entry master degree depending on the association. HCF requires the same bachelor degrees as BUPA and membership of one of five associations. The effect of the diverse standards applied between the major insurers means that patients of acupuncturists with qualifications below a bachelor degree have not been eligible for health fund rebates from BUPA Australia or HCF (nearly 40% of the market) unless the acupuncturist was already a provider before the implementation of Rule 10. Graduates of sub-degree programs may be attracted to Medibank’s members choice program (a preferred provider scheme) in order to increase the proportion of these clients in their practice.

MEDICARE AND MEDICAL PRACTITIONERS

Medicare payments are available for acupuncture services provided by medical practitioners under Medicare Items 173, 193, 195, 197 and 199. Medicare sets no education requirements for acupuncture training for medical practitioners to be eligible to provide services under item 173. Eighty-one thousand seven hundred and forty-eight (81 748) services at
Acupuncture education standards in Australia are diverse and can be grouped into four main categories: standards for Chinese medicine practitioners; standards for medical practitioners; standards for other registered allied health professionals; and standards for non-registered health practitioners. Presently the CMRBV only directly regulates acupuncturists who are eligible for registration under the HPRA. Outside of Victoria acupuncturists are self-regulated. Despite this regulatory difference education standards for acupuncturists in Australia generally conform to or exceed the WHO GBT (see Table 1). The regulatory influence of private health insurers such as Bupa Australia and HCF provides a clear financial incentive to graduate from a recognised bachelor degree program which is not conducted substantially by flexible delivery or distance education.

INTERNATIONAL EDUCATION STANDARDS

The World Health Organization published Guidelines on Basic Training Safety in Acupuncture in 1999 (see Table 1). The guidelines comprise education standards for non-medical acupuncturists as well as medical practitioners who wish to use acupuncture clinically. The guidelines were intended to assist national health authorities and training institutions to develop examination standards and training programs respectively.

The guidelines recommend that nonmedical acupuncturists complete two years and 2500 hours education with at least 1000 hours of practical and clinical work. A full training course for medical practitioners should comprise 1500 hours with at least 1000 hours of practical and clinical work. The same core syllabus should be followed as for non-medical acupuncture. Limited training in acupuncture for medical practitioners would comprise of at least 200 hours of formal training derived from the core syllabus. Other primary care health personnel are recommended to study acupressure rather than acupuncture as "Training in acupressure would make no great demands, could be incorporated into the general training of primary health care personnel, and would carry no risk to the patient."29

Discussion

Acupuncture education standards in Australia are diverse and can be grouped into four main categories: standards for Chinese medicine practitioners; standards for medical practitioners; standards for other registered allied health professionals; and standards for non-registered health practitioners. Presently the CMRBV only directly regulates acupuncturists who are eligible for registration under the HPRA. Outside of Victoria acupuncturists are self-regulated. Despite this regulatory difference education standards for acupuncturists in Australia generally conform to or exceed the WHO GBT (see Table 1). The regulatory influence of private health insurers such as Bupa Australia and HCF provides a clear financial incentive to graduate from a recognised bachelor degree program which is not conducted substantially by flexible delivery or distance education.
The growth of courses providing ‘dry needling’ or ‘myofascial dry needling’ appears to have coincided with the regulation of acupuncture in Victoria. Subjects once taught as ‘myofascial acupuncture for myotherapists’ are now called ‘myofascial dry needling’. Courses of two or three days duration are marketed to both registered professions and non-registered practitioners alike. Of the allied health professions only the APA and AAMT have publically identifiable guidelines for acupuncture training for its members. Neither guideline is a standard as there is no compulsion to follow them. Substantive training in acupuncture which does broadly conform to the WHO GBT is available at the post-graduate level for the very health professionals to whom the short ‘dry needling’ courses are marketed to.

The standards underpinning training in medical acupuncture remain obscured. Despite public funding through Medicare, Medicare does not set an education standard for acupuncture item eligibility. Instead it refers to an external assessment by JCCMA and AMAC which do not publish details of their requirements while also delivering one of the courses. Changes in the course content, delivery and assessment are invisible to public scrutiny making it impossible to definitively determine what changes, if any have occurred over time with medical acupuncture accreditation. This is in stark contrast to the detailed publically available course accreditation standards and procedures developed by the CMRB. The National Law requires transparency in the development of accreditation standards so for the first time details of the medical acupuncture standard may be available to public review. The details that are in the public domain align medical acupuncture accreditation in Australia to the WHO GBT criteria for limited training in medical acupuncture. Medical practitioners would need to complete the current Master of Applied Science (Acupuncture) at RMIT or similar to achieve the WHO GBT standard for medical acupuncture.

An objective of the HPRA was to regulate risky health practices to protect public health and safety. The National Law shares the objective of protecting public health and safety and also requires improved education standards. Restriction of title is designed to allow the consumer to identify not only safe practitioners but also competent ones. Victorian registration has led to the highest standards for registered acupuncturists but much lower standards in other parts of the health community. Chiropractors have reduced their education standards for acupuncture and other health practitioners openly practise acupuncture after a two day course under the name of dry needling.

Accreditation bodies and national boards will need to carefully consider the range of education standards underpinning acupuncture practice when developing an accreditation standard for registration or endorsement. The ability of the public to identify both safe and competent acupuncturists will not be served if nine or more different education standards permit the use of the title. The trend of teaching and practising acupuncture under the name dry needling directly challenges the intent of the statutory regulation of acupuncture and may require a legislative solution if the objectives of the NRAS cannot be fulfilled by the development of accreditation standards and enforcement of registration standards. Achieving the objectives of the NRAS to protect public health and safety, provide quality health care, and improve education standards will require a co-operative effort from the respective accreditation authorities and boards.

Clinical Commentary

Practitioners, other than Chinese medicine practitioners, will be able to use the title acupuncturist after 1 July 2012 if their Board endorses them as suitably qualified to practise acupuncture. At the same time both registered and unregulated practitioners are avoiding regulation altogether by completing two or three day courses and calling their practice ‘dry needling’ rather than acupuncture. This paper identifies the education standards underpinning the acupuncture practice of various health professions with a view to informing regulators of a range of issues to consider when setting an accreditation standard.
